Grounding: the same counting pattern can answer a different question

Question: Which customers placed at least two distinct orders?

Source: Orders (one row per order)

oid	cid
1	C1
2	C1
3	C2

```
SELECT cid FROM Orders
GROUP BY cid
HAVING COUNT(*) >= 2;
```

Correct result: **C1**

C1 has two orders; C2 has one.

Each counted row is one distinct order.

Target: Lines (one row per order line)

oid	lid	cid
8	1	C1
8	2	C1
9	1	C2
10	1	C2

C1: one order, two lines.

```
SELECT cid FROM Lines
GROUP BY cid
HAVING COUNT(*) >= 2;
```

Incorrect result: **C1, C2**

Count distinct orders instead:

```
HAVING COUNT(DISTINCT oid) >= 2;
```

Correct result: **C2**

Identifiers: cid = customer; oid = order; lid = line within an order.
